Subject: GENERATIONAL TOBACCO BAN (NICOTINE FREE GENERATION)
To: <swilliams@belchertown.org>

Mr. Williama:

A Generational Tobacco Ban (Nicotine Free Generation) does not affect youth, as its proponents say. It affects persons 21 years old and older only. Stores already face fines for selling tobacco or nicotine products to persons under 21. A generational Tobacco Ban In a few years could mean that a 30-year-old Combat veteran could not legally buy cigarettes, while a 21-year-old could vote, join the military, and buy alcohol or marijuana. This is tobacco control out of control.

According to the Centers for Disease Control, teen cigarette smoking is at an all-time low and teen vaping is at a ten-year low, The CDC reports also that fewer than 2% of teens use nicotine pouches. Gallup reports adult smoking at a 80-year-low. Also, according to the CDC, two of every three adults who have ever smoked have quit. It may be difficult to quit, but millions have done so

With tobacco and vaping rates so low for both adults and teens, and teen use of nicotine pouches less than 2%, there is no reason to impose further onerous restrictions on retailers. Many of them are immigrants of color who work long hours and depend on small profit margins. Further restrictions would hurt them. They are part of the community, not adversaries, and they deserve to be treated as such.

It would create two classes of citizen. Some 30-year-olds would be able to buy tobacco products and other 30-year-olds could not, based not on their age, but their birth date. This is arbitrary and capricious. The Massachusetts Supreme Judicial Court has upheld this policy, but it poses serious constitutional questions.

A generational Tobacco ban unjustifiably curtails adult liberty, serves no public health need, hurts Belchertown merchants, and may be ruled unconstitutional. Please do not impose it.

Sources:

In an annual survey conducted in schools across the nation, fewer than 8 percent of high school students reported using e-cigarettes in the past month, the lowest level in a decade. Some compared the news to the decline in smoking traditional cigarettes, which at about 1.6 percent of teenagers, has reached a notable low.

New York Times, 9/6/24

E-cigarettes were the most commonly reported currently used tobacco product (5.9%) among all students, followed by nicotine pouches (1.8%), cigarettes (1.4%),

CDC MMWR Report (Oct. 17, '24)
